

**Economic and effective  
alternative to a mulcher.  
Precise cutting of post-harvest  
residue and combating  
the European corn borer.**

**The ProCut knife roller on the tractor's  
front three-point linkage**

## The ProCut knife roller on the tractor's front three-point linkage

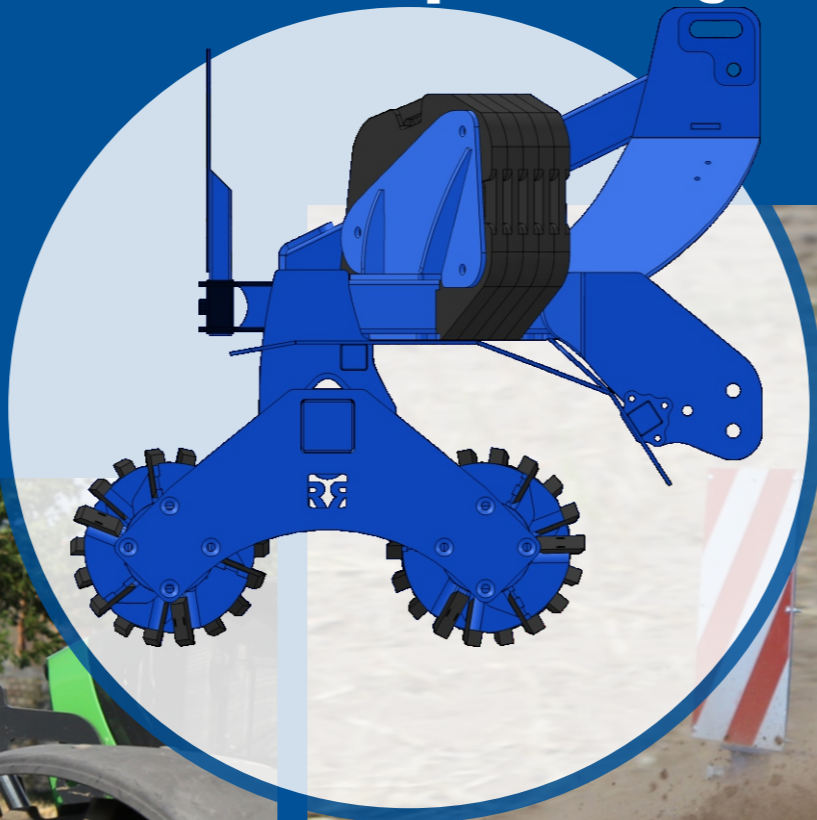

The ProCut knife roller is a tandem type device consisting of two cutting rotors with a diameter of  $\varnothing$  375 mm. At a 3.0 m width of the roller, 6 rows of obliquely arranged knives divided into 5 segments. The aggressively operating roller is protected against damage by four sections of rubber shock absorbers with a diameter of  $\varnothing$  50 mm. The oblique arrangement of knives provides the even distribution of cutting force, and as a consequence, an even work effect. The rollers' knives are arranged at the opposite angle, which allows to obtain a cross-cutting effect.

**Replaceable knives made of Hardox steel with a thickness of 8 mm characterised by high strength. We use double-sided knives, so that it is possible to cultivate twice as large area on one set of working elements.**

Safety is crucial; therefore, each knife is fastened with 4 screws. The standard equipment element is the roller cover made of sheet metal. The solid fastenings of knives are welded to the thick-walled pipe 178 mm x 10 mm.

### Optional systems

- weights (80 kg x multiple)
- reflective plates
- LED lighting
- maintenance-free roller bearings

The ProCut knife roller is intended for intensive grinding of post-harvest residue after corn and rapeseed as well as green mass of aftercrop plants. It is also a very good tool to combat European corn borer larvae preying on corn stalks. The ProCut roller can operate at a speed of 5-20 km/h, and the recommended working speed is more than 12 km/h. The knife roller should operate with a depth not exceeding 3 cm.

**The ProCut front knife roller works perfectly in the field, as a solo device, as well as in combination with other tillage machines mounted on the tractor's rear jack. The ProCut knife roller at the front and the disc harrow operating at the rear of the tractor constitute a perfect combination and they are a recommended set of tillage cultivators for stand after corn.**
